

# Scientific Diagnosis of the Complex System of the Tskhinvali Conflict and Innovative Holistic Model of the Peace Process

## Abstract

Resources of science were not used enough for the management of such problem as unresolved Tskhinvali conflict.

Objective of the project:

By means of innovated scientific interdisciplinary diagnostic method 4D-RAV-17 and evaluation 4-dimensional research to prove that existing “peace process” is inadequate to the structure of the conflict and formation of the holistic model of the alternative peace process contributing to positive transformation of complex system of Tskhinvali conflict. The project also intends to provide scientific and informational-analytical support for peace process.

The object of the research is “Complex System of Tskhinvali Conflict” (CSTC). CSTC includes the following elements: the conflict itself; produced by it new generation of real and unreal conflicts (pseudo-conflicts); quazi peace processes and peace processes.

“**Scientific diagnosis of the Complex System of Tskhinvali Conflict (CSTC)**” represents the valuable scientific result of the project.

Such a diagnosis could be done using either reductionist thinking approach or holistic thinking approach. The project team is applying holistic thinking approach as to our opinion main reason of unresolved status of the conflict is exactly the style of reductionist thinking and acting.

As a result of reductionist perception and interpretation the Complex System of Tskhinvali Conflict was minimized to its separate components and that represents the ground for inadequate diagnosis and is a reason for formation of quazi peace process. The last one is immediate cause of unresolved status of the conflict.

The research project proposes an alternative way – setting a holistic diagnosis and **formation of a model of alternative peace process** in accordance with the set diagnosis.
